Do Price Tags Tilt Decisions?

- 164 NZ councillors, three randomized information groups
- $ shown: choices shift before any model

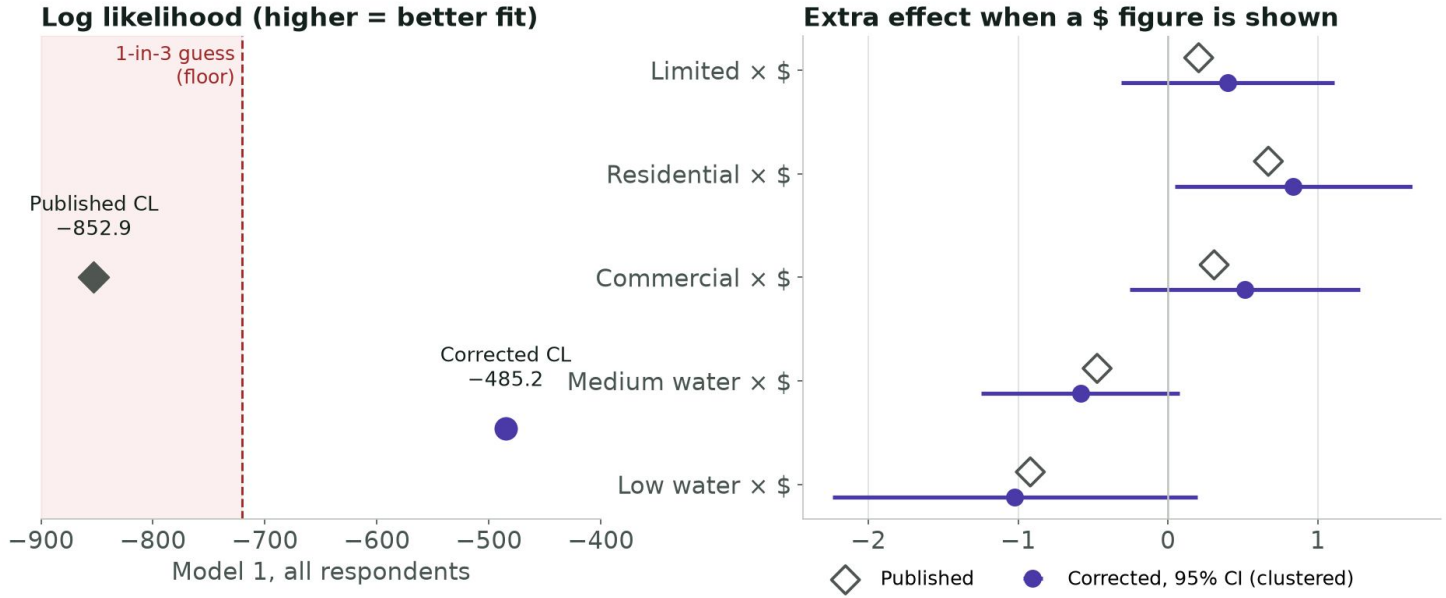

We Reproduced the Main Model

- 20 of 24 coefficients match to 3 decimals
- Remaining 4: reporting errors in the paper

Appraisal

- Exact match requires pooling cards across respondents
- Corrected: same direction, wider intervals
- Mixed logit unstable across simulation draws

Takeaway for Councils

- Priced impacts weigh roughly 18–36% more
- Give unpriced impacts (culture, habitat) equal prominence
