over this question. **For sure, you can expect in the exam a question like #5**, where you need to construct a given distribution (e.g., Chi-squared, t or F) based on normally distributed rar
* PS8: 1ab, 2ab, 3a (for both MOM and MLE), part 3b only for the MOM estimator (not the MLE), and 4a to 4d. **For sure, you can expect a question similar to 2a/2b in the exam, and**
* PS9: 1, 2, 3a. For question 1, finding the variance of the estimators is not very straightforward. In the exam, if I ask a similar question, it would be one where finding the mean and varia 2 in practice final, or question #2 in PS10). Also, **for sure, you can expect a question similar to 2a/2b in the exam.**
* PS10: all. **For sure, you can expect a question about finding the asymptotic distribution of the MLE (e.g., 4b and 6a), and another about showing that an estimator is consisten** likely (e.g., 3b and 6b).
* PS11 (not to be covered in final exam): The main topic in this problem set is how to test hypotheses and construct confidence intervals. Please try to go over the problem set at some poi answer any questions you have on this problem set; just let me know.

You will be allowed to have during the test the cheat sheet with formulas you used for the midterm, as well as another one with formulas from the second part of the class. Hence, 2 pages formulas ("steps" on how to solve problems is ok, too). NO examples and NO exercises are to be included here (otherwise I would have to ask harder questions in the test). You will with your cheat sheets. I will return them at the start of the Fall semester so you can keep them for future reference.

In the test, you will be given any pdf, E(X) or Var(X) you need to solve the problems. You do NOT need to write in your cheat sheet the pdf, mean and variance of every distribution.

Remember that the final exam is scheduled for Monday from 10:10am to 2:00pm in our same classroom (3-300A). I'll plan for a test shorter than 4 hours, though (hopefully about 2 hrs o

Finally, **I'll have office hours tentatively on Friday from 3:00pm to 4:00pm** but I can stay longer if needed. As I mentioned in class, unfortunately they will have to be via zoom as I ha truly apologize for the inconvenience. I do have a camera from "the Covid days" that I'm taking with me that allows me to share my handwriting clearly on the screen. I'll send the zoom the OHs, please e-mail me and we'll find some other time to meet.

I think that's all for now. I hope this information is helpful. I know you're already pretty tired from all the work in GSE 510 and GSE 518, but you're almost done with the intersession! K

Best,

Carlos
